**LECTURER: TAILE QUY** 

# MACHINE LEARNING UNSUPERVISED LEARNING AND FEATURE ENGINEERING

#### **INTRODUCTORY ROUND**

# Who am I?

- Name: Tai Le Quy
- PhD candidate at L3S Research Center –
   Leibniz University Hannover
- Topic: Fairness-aware machine learning in educational data mining
- Project: LernMINT (lernmint.org)
- MSc in Information Technology at National University of Vietnam
- Profile: <u>tailequy.github.io</u>
- Email: tai.le-quy@iu.org

#### **INTRODUCTORY ROUND**

# Who are you?

- Name
- Employer
- Position/responsibilities
- Fun Fact
- Previous knowledge? Expectations?

INTRODUCTION TO UNSUPERVISED MACHINE LEARNING AND FEATURE ENGINEERING	1
CLUSTERING	2
DIMENSIONALITY REDUCTION	3
FEATURE ENGINEERING	4
FEATURE SELECTION	5
AUTOMATED FEATURE GENERATION	6

UNIT1

# INTRODUCTION TO UNSUPERVISED MACHINE LEARNING AND FEATURE ENGINEERING

#### **STUDY GOALS**

0

- Explain the **general principal** of unsupervised machine learning and its **applications** to real-life problems.
- Define what **features** are, their **types**, their interest for unsupervised machine learning, and their **challenges**.
- Explain the **steps of designing** an unsupervised machine learning **model**.
- Adapt or transform features for an unsupervised machine learning model.
- Evaluate and improve the performance of an unsupervised machine learning model.

1. Explain the main difference between clustering and dimensionality reduction.

- 2. Describe the main goals of feature engineering.
- 3. Briefly describe the main steps to build a successful unsupervised machine learning model?

#### **UNIT CONTENT**

# **Unsupervised machine learning**

- Clustering algorithms
- Dimensionality reduction
- Real-life applications

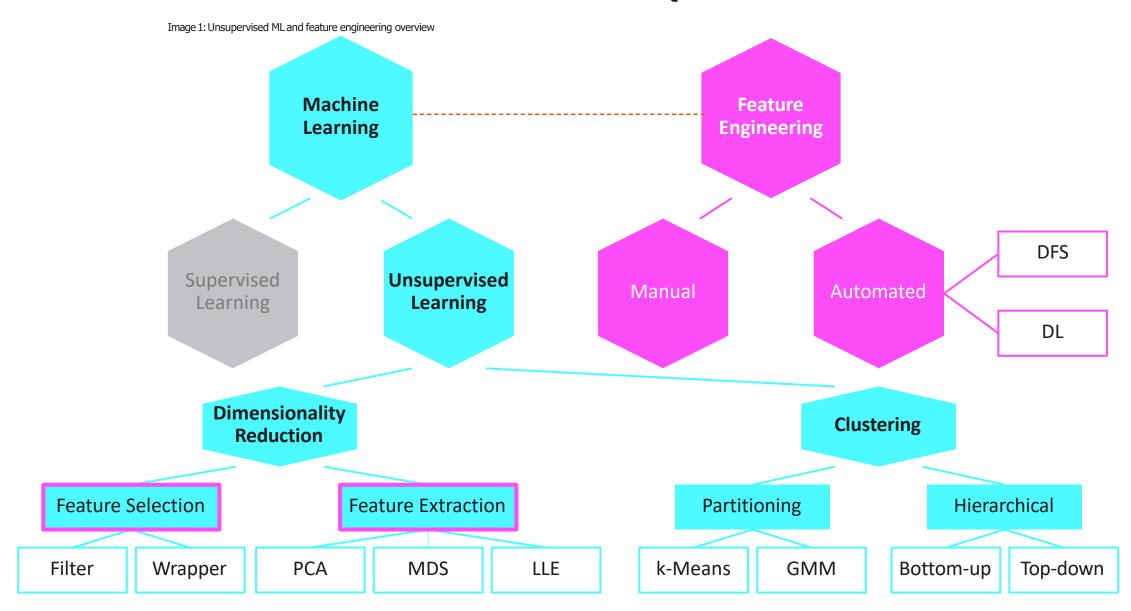

# Feature engineering

- Definition, types, and motivation
- Types and steps

Steps to build a successful unsupervised learning model

This presenation does **not cover the entire content** of
the coursebook unit! It
focusses on some aspects.

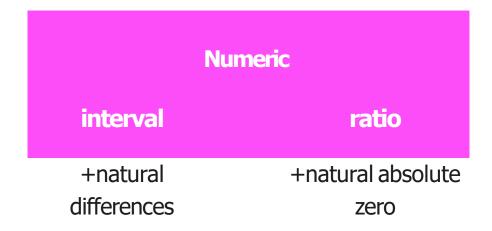

#### OVERVIEW OF UNSUPERVISED MACHINE LEARNING AND FEATURE ENGINEERING TECHNIQUES

#### LEVEL OF MEASUREMENT

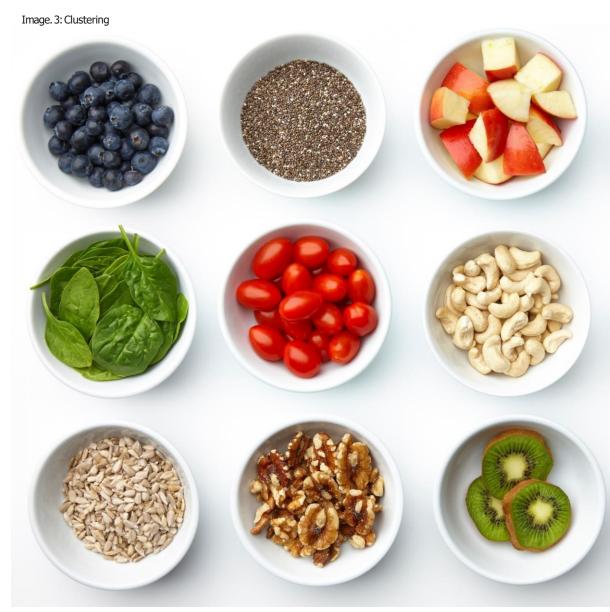

Image 2: Levels of measurement

Categorical	
nominal	ordinal
Names	+natural order

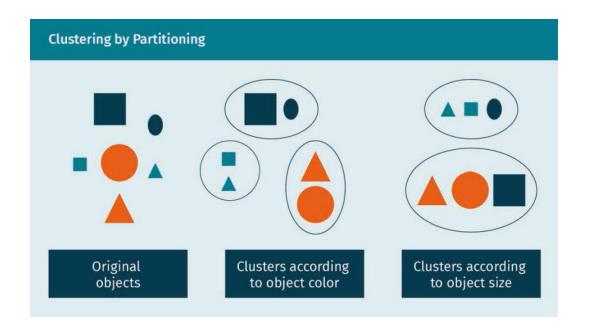

#### **CLUSTERING**

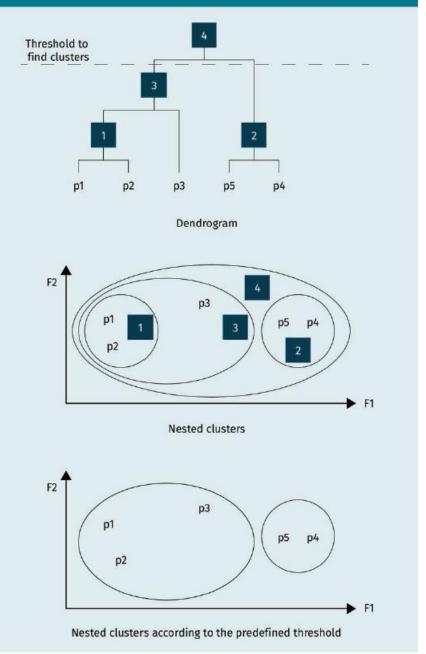

- Subdivide a data set of *n* samples into *k groups*, i.e., clusters.
- Samples in one cluster should be similar.
- Sample from different clusters
   should be different from each other.
- Different approaches
  - Partitioning (k-Means, GMM, DBSCAN)
  - Hierarchical clustering

#### CLUSTERING

#### Hierarchical (Agglomerative) Clustering

#### REAL-LIFE APPLICATION S OF UNSUPERVISED MACHINE LEARNING

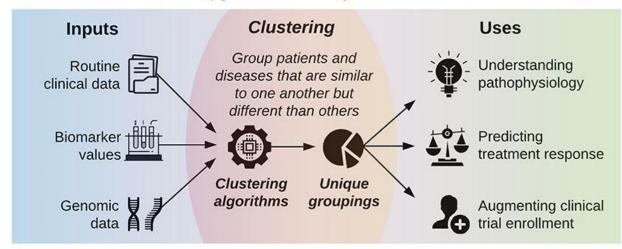

- Medical diagnosis
- Fault diagnosis of industrial systems
- Customer segmentation or client profiling
- Crime and fraud detection

Customer loyalty is the act of choosing one company's products and services consistently over their competitors. When a customer is loyal to one company, they aren't easily swayed by price or availability. They would rather pay more and ensure the same quality service and product they know and love.

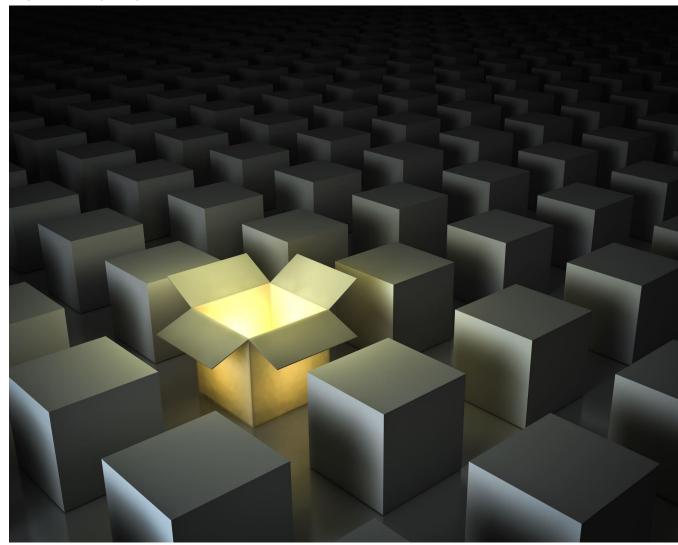

#### **Phenotype Clustering in Health Care**

#### **FEATURE ENGINEERING**

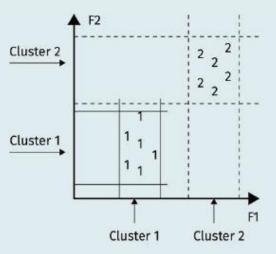

- Avoid **overfitting** and keep models **simple** (*curse of dimensionality*).
- Only use relevant features.
- Feature which contain unique information.
- Feature Selection
  - Wrapper methods
  - Filter methods
  - Embedded methods

Image. 4: Feature engineering

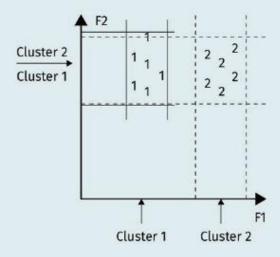

#### **FEATURE SELECTION**

#### Redundant and Irrelevant Features

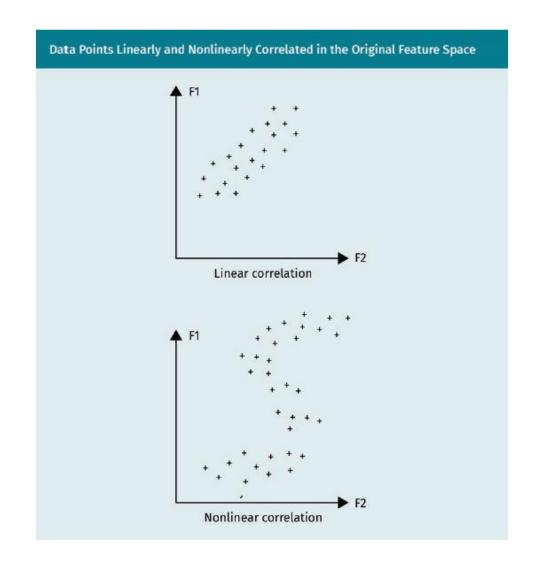

Two redundant features F1 and F2

F2 is irrelevant and misguides the clustering

#### **FEATURE EXTRACTION**

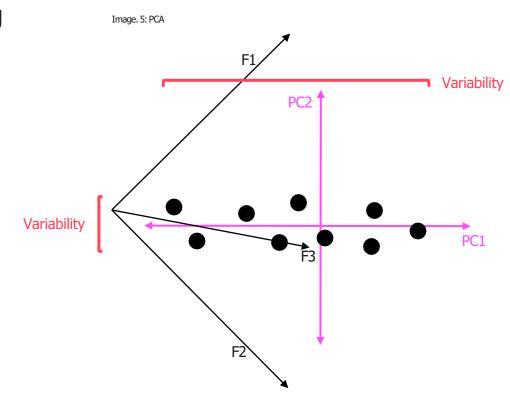

- Linear dimensionality reduction methods
  - Principal component analysis (PCA), Factor
     Analysis, and Linear Discriminant Analysis
  - The original data points are linearly correlated and thus can be linearly transformed and projected into a reduced new feature space.
- Nonlinear dimensionality reduction methods
  - Multi-Dimensional Scaling (MDS), Locally Linear
     Embedding (LLE), and Kernel PCA
  - The original data points are correlated in the feature space in nonlinear way

#### DIMENSIONALITY REDUCTION, PCA AND FEATURE SELECTION

## **Principal Component Analysis (PCA)**

- New axis, maximizing the variance in the data along this axis (PC1).
- PC2: Orthogonal to PC1
- ...
- Rotate and center to PC feature space.
- PC1 contains most of the variability.
- PC2 less than PC1
- \_ ..
- Feature selection
  - Use PCs for modeling.
  - Use loading scores to identify informative original features.

#### **FEATURE ENGINEERING**

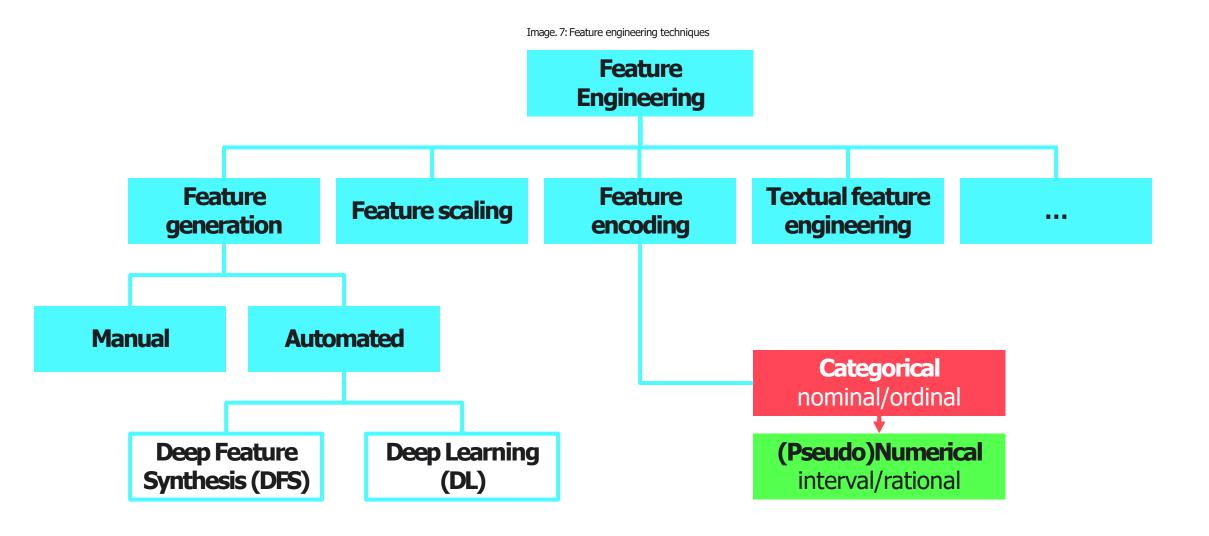

- The performance of machine learning models largely depends on the input features.
- Relevant information might not be directly accessible by the ML algorithms.
- Expose relevant information for the modeling step by...
  - Extraction
  - Aggregation
  - Filtering

Image. 6: Hidden information

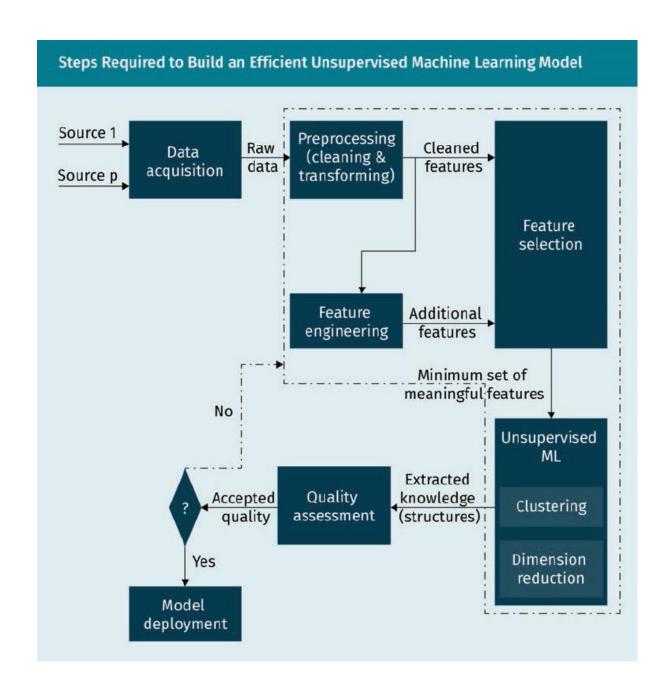

#### **FEATURE ENGINEERING**

#### STEPS TO BUILD A SUCCESSFUL UNSUPERVISED LEARNING MODEL

- Data acquisition
- Preprocessing
- Feature selection/engineering
- Unsupervised ML
- Quality assessment
- Model deployment

#### **REVIEWSTUDY GOALS**

- Explain the **general principal** of unsupervised machine learning and its **applications** to real-life problems.
- Define what **features** are, their **types**, their interest for unsupervised machine learning, and their **challenges**.
- Explain the **steps of designing** an unsupervised machine learning **model**.
- Adapt or transform features for an unsupervised machine learning model.
- Evaluate and improve the performance of an unsupervised machine learning model.

### SESSION 1

# TRANSFER TASK

#### **TRANSFER TASKS**

A start-up that sells **sustainable products in smaller stores** has been very successful in recent years. As a result, more stores are to be opened worldwide.

To keep an **overview of the offered products**, you and your team of Data Scientists are tasked to **define homogeneous groups of products** to facilitate ordering, marketing, and distribution.

**Create a rough project plan** to achieve this goal. **For each phase** of this plan, explain which **unsupervised machine learning and feature engineering techniques** might be applied.

TRANSFERTASK
PRESENTATION OF THE RESULTS

Please present your results.

The results will be discussed in plenary.

#### **LEARNING CONTROL QUESTIONS**

- 1. Which of the following techniques is used to transform an original feature space into a new, smaller feature space?
  - a) dimensionality reduction
  - b) feature selection
  - c) hierarchical decomposition
  - d) partitioning techniques

#### **LEARNING CONTROL QUESTIONS**

- 2. Which of the following methods is a recommended technique for non-linear dimensionality reduction?
  - a) k-means
  - b) Gaussian mixture model
  - C) Principal components analysis
  - d) Multi-dimensional scaling

- 3. At what point does a learned model become susceptible to overfitting?
  - a) When the number of data points is high.
  - b) When the number of features grows for a given number of data points.
  - C) When the data points are non-linearly correlated.
  - d) When the data points are linearly correlated.
